CYTOKINE, ESPECIALLY TNF-ALPHA, INHIBITORS

This invention relates to N-heterocyclic compounds that are effective in blocking cytokine production, and in particular the expression of TNF-alpha (TNF- α), via inhibition of p38 kinase. Compounds of the present invention are useful in the treatment of inflammatory diseases such as, for example, rheumatoid arthritis.

Overproduction of cytokines such as IL-1 and TNF- α is implicated in a wide variety of inflammatory diseases, including rheumatoid arthritis (RA), psoriasis, multiple sclerosis, inflammatory bowel disease, endotoxin shock, osteoporosis, Alzheimer's disease and congestive heart failure, among others [Henry *et al.*, *Drugs Fut.*, 24:1345-1354 (1999); Salituro *et al.*, *Curr. Med. Chem.*, 6:807-823 (1999)]. There is convincing evidence in human patients that protein antagonists of cytokines, such as, for example, monoclonal antibody to TNF- α (Enbrel) [Rankin *et al.*, *Br. J. Rheumatol.*, 34:334-342 (1995)], soluble TNF- α receptor-Fc fusion protein (Etanercept) [Moreland *et al.*, *Ann. Intern. Med.*, 130:478-486 (1999)] and or IL-1 receptor antagonist [Bresnihan *et al.*, *Arthritis Rheum.*, 41:2196-2204 (1998)], can provide effective treatment for chronic inflammatory diseases. As none of the current treatments for inflammatory diseases provide complete relief of symptoms, and as most current treatments are associated with various drawbacks such as side effects, improved methods for treating inflammatory diseases are desirable.

TNF- α is a protein whose synthesis occurs in many cell types in response to an external stimulus, such as, for example, a mitogen, an infectious organism, or trauma. Signaling from the cell surface to the nucleus proceeds via several intracellular mediators including kinases that catalyze phosphorylation of proteins downstream in the signaling cascade. Important mediators for the production of TNF- α cytokine are the mitogen-activated protein (MAP) kinases, and in particular, p38 kinase.

p38 Kinases are activated in response to various stress stimuli, including, but not limited to, proinflammatory cytokines, endotoxin, ultraviolet light, and osmotic shock. Activation of p38 requires dual phosphorylation by upstream MAP kinase kinases (MKK3 and MKK6) on threonine and tyrosine within a Thr-Gly-Tyr motif, characteristic of p38 isozymes.

Four iso-forms of p38 have been described. The α and β forms are expressed in inflammatory cells and are thought to be key mediators of TNF- α production. Inhibition of the enzymes p38 α and β in cells results in reduced levels of expression of TNF- α , and such inhibitors are effective in animal models of inflammatory disease.

Molecular cloning of human p38 α identified two isozymes, which are the splice variant product of a single gene. Three additional gene products have subsequently been identified, p38 β , p38 γ , and p38 δ . p38 kinases phosphorylate and activate the transcription factors, ATF-2, MAX, CHOP, and C/ERF, suggesting a role of p38 kinases in gene regulation. In addition, p38 kinases phosphorylate other protein kinases, such as MAPK activated protein kinase-2/3 (MAPKAP-K2/3, or MK2/3), and MAP-kinase-interacting kinase 1/2 (MNK1/2). Recently, activation of MK2 has been shown to be essential for LPS-induced TNF- α expression [Kotlyarov *et al.*, *Nature Cell Biol.*, 1:94-97 (1999)]. Mice lacking MK2 exhibit a 90% reduction in the production of TNF- α and are resistant to shock induced by LPS. The reduction in TNF- α amounts is due not to decreased production of the TNF- α mRNA, but rather to diminished production of the TNF- α protein, suggesting that MK2 regulates biosynthesis of TNF- α at a post-transcriptional level.

Ample evidence indicates that the p38 pathway serves an important role in inflammatory process mediated by IL-1 and TNF- α .

Small molecule inhibitors of p38 are expected to have several advantages over protein inhibitors of TNF- α or IL-1. p38-inhibitors not only block the production of TNF- α and IL-1, but also directly interfere with many of their secondary biological effects. In addition, small molecule inhibitors are unlikely to induce immune reaction in patients, and are believed active following oral administration.

The present invention provides novel compounds that are potent and selective inhibitors of p38 α and β , and as such, are also potent inhibitors of TNF- α expression in human cells. Compounds of the present invention are useful in the treatment of p38- and TNF- α expression-mediated inflammatory and other disorders, including, but not limited to, bone resorption, graft vs. host reaction, atherosclerosis, arthritis, osteoarthritis, rheumatoid arthritis, gout, psoriasis, topical inflammatory disease states, adult respiratory distress syndrome, asthma, chronic pulmonary inflammatory disease, cardiac reperfusion injury, renal reperfusion injury, thrombus, glomerulonephritis, Crohn's disease, ulcerative colitis, inflammatory bowel disease, multiple sclerosis, endotoxin shock, osteoporosis, Alzheimer's disease, congestive heart failure and cachexia.

The compounds of the present invention are effective as inhibitors of inappropriate p38 activity, especially iso forms α and β , and in turn, of cytokine production, and in particular, of cellular TNF-alpha (TNF- α) expression. Accordingly, compounds of the invention are useful for the inhibition, prevention and suppression of various pathologies associated with such activity, such as, for example, inflammation, asthma, arthritis, atherosclerosis, multiple sclerosis, psoriasis, autoimmune diseases, Alzheimer's disease and congestive heart failure, among others.

With regard to the present invention, a prodrug of a compound of Formula I is intended to mean any compound that is converted to a compound of Formula I by metabolic processes *in vivo*. The use of prodrugs of compounds of Formula I in any of the methods described herein is contemplated and is intended to be within the scope of the invention.

Terminology related to "protected," "protecting" and/or "deprotecting" functionalities is used throughout this application. Such terminology is well understood by persons of skill in the art and is used in the context of processes which involve sequential

treatment with a series of reagents. In this context, a protecting group refers to a group which is used to mask a functionality during a process step in which it would otherwise react, but in which reaction is undesirable. The protecting group prevents reaction at that step, but may be subsequently removed to expose the original functionality. The removal or "deprotection" occurs after the completion of the reaction or reactions in which the functionality would interfere. Thus, when a sequence of reagents is specified, as it is in the processes of the invention, the person of ordinary skill can readily envision those groups that would be suitable as "protecting groups" for the functionalities involved.

In the case of the present invention, the typical functionalities that must be protected are amines. Suitable groups for that purpose are discussed in standard textbooks in the field of chemistry, such as Protective Groups in Organic Synthesis by T.W. Greene [John Wiley & Sons, New York, 1991], which is incorporated herein by reference. Particular attention is drawn to the chapter entitled "Protection for the Amino Group" (pages 309-405). Preferred protecting groups include BOC and Fmoc. Exemplary methods for protecting and deprotecting with these groups are found in Greene and Wuts on pages 318 and 327.

The materials upon which the syntheses described herein are performed are referred to as solid supports, beads, and resins. These terms are intended to include: (a) beads, pellets, disks, fibers, gels, or particles such as cellulose beads, pore-glass beads, silica gels, polystyrene beads optionally cross-linked with divinylbenzene and optionally grafted with polyethylene glycol, poly-acrylamide beads, latex beads, dimethylacrylamide beads optionally cross-linked with *N,N'*-bis-acryloyl ethylene diamine, glass particles coated with hydrophobic polymer, etc., i.e., material having a rigid or semi-rigid surface; and (b) soluble supports such as polyethylene glycol or low molecular weight, non-cross-linked polystyrene. The solid supports may, and usually do, have functional groups such as amino, hydroxy, carboxyl, or halo groups; where amino groups are the most common.

TentaGel™ NH₂ (Rapp Polymere, Tubingen, Germany) is a preferred amine functionalized polyethylene glycol-grafted polystyrene resin. TentaGel™-S-PHB resin has a para-hydroxy benzyl linker which can be cleaved by the use of 90% trifluoroacetic acid in DCM. Techniques for functionalizing the surface of solid

phases are well known in the art. Attachment of lysine to the amino groups on a bead (to increase the number of available sites) and subsequent attachment of linkers as well as further steps in a typical combinatorial synthesis are described, for example, in PCT application WO95/30642, the disclosure of which is incorporated herein by reference. In the synthesis described in WO95/30642, the linker is a photolytically cleavable linker, but the general principles of the use of a linker are well illustrated.

Optical Isomers - Diastereomers - Geometric Isomers

Some of the compounds described herein contain one or more asymmetric centers and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms which may be defined in terms of absolute stereochemistry as (*R*)- or (*S*)-, or as (*D*)- or (*L*)- for amino acids. The present invention is meant to include all such possible diastereomers as well as their racemic and optically pure forms. Optically active (*R*)- and (*S*)-, or (*D*)- and (*L*)- isomers may be prepared using chiral synthons or chiral reagents, or optically resolved using conventional techniques. When the compounds described herein contain olefinic double bonds or other centers of geometric asymmetry, and unless specified otherwise, it is intended to include both (*E*)- and (*Z*)- geometric isomers. Likewise, all tautomeric forms are intended to be included.

Compounds of the invention which incorporate chiral diamines may be resolved into pairs of enantiomers by known techniques. Where pure enantiomers of starting materials are not commercially available, they may be obtained by classic resolution, which may employ, for example, fractional crystallization of diastereomeric salts. Compounds of the invention may have more than one chiral center, for example wherein reductive amination of a homochiral intermediate leads to a mixture of diastereomers. Racemic intermediates and compounds of the invention may also be resolved by chromatographic separation, such as for example, HPLC using a column loaded with a homochiral support, to yield pure isomeric compounds.

The configuration of any carbon-carbon double bond appearing herein is selected for convenience only and is not intended to designate a particular configuration; thus a carbon-carbon double bond depicted arbitrarily herein as *trans* may be *cis*, *trans*, or a mixture of the two in any proportion.

In view of the above definitions, other chemical terms used throughout this application can be easily understood by those of skill in the art. Terms may be used alone or in any combination thereof. The preferred and more preferred chain lengths of the radicals apply to all such combinations.

Biological Assays

Generation of p38 Kinases

cDNAs of human p38 α , β and γ isozymes were cloned by PCR. These cDNAs were subcloned in the pGEX expression vector (Pharmacia). GST-p38 fusion protein was expressed in *E. Coli* and purified from bacterial pellets by affinity chromatography using glutathione agarose. p38 fusion protein was activated by incubating with constitutively active MKK6. Active p38 was separated from MKK6 by affinity chromatography. Constitutively active MKK6 was generated according to Raingeaud *et al.* [*Mol. Cell. Biol.*, 1247-1255 (1996)].

TNF- α Production by LPS-Stimulated PBMCs

Heparinized human whole blood was obtained from healthy volunteers. Peripheral blood mononuclear cells (PBMCs) were purified from human whole blood by Ficoll-Hypaque density gradient centrifugation and resuspended at a concentration of 5×10^6 /ml in assay medium (RPMI medium containing 10% fetal bovine serum). 50 μ l of cell suspension was incubated with 50 μ l of test compound (4X concentration in assay medium containing 0.2% DMSO) in 96 well-tissue culture plates for 5 minutes at room temperature. 100 μ l of LPS (200 ng/ml stock) was then added to the cell suspension and the plate was incubated for 6 hours at 37°C. Following incubation, the culture medium was collected and stored at -20°C. TNF α concentration in the medium was quantified using a standard ELISA kit (Pharmingen-San Diego, CA). Concentrations of TNF α and IC_{50} values for test compounds (concentration of compound that inhibited LPS-stimulated TNF α production by 50%) were calculated by linear regression analysis.

LPS-Induced TNF Production in THP-1 Cells

Human monocytic THP-1 cells were maintained in RPMI 1640 medium supplemented with 10% fetal bovine serum. Cells (40,000 cells in 80 μ l) were added to wells of 96-well flat-bottomed plates. Tested compounds (10 μ l) or vehicle (3 % DMSO) were added to wells. Subsequently, LPS (Sigma, #L7261; 10 μ l/well) was added to the cells for a final concentration of 1 μ g/mL. Plates were incubated overnight at 37° C and 5% CO₂. Supernatant (50 μ l/well) was harvested for an ELISA assay. TNF was captured by an anti-human TNF antibody (R&D, #MAB610) which was pre-absorbed in high binding EIA plates (Costar, #3590). Captured TNF was recognized by a biotinlated anti-human TNF polyclonal antibody (R&D, #BAF210). Streptavidin conjugated with peroxidase was added to each well, and the activity of peroxidase was quantitated by a peroxide substrate kit (Pierce, #34062 and #34006).

p38 Assay

The assays were performed in V-bottomed 96-well plates. The final assay volume was 60 μ l prepared from three 20 μ l additions of enzyme, substrates (MBP and ATP) and test compounds in assay buffer (50 mM Tris pH 7.5, 10 mM MgCl₂, 50 mM NaCl and 1 mM DTT). Bacterially expressed, activated p38 was pre-incubated with test compounds for 10 min. prior to initiation of reaction with substrates. The reaction was incubated at 25° C for 45 min. and terminated by adding 5 μ l of 0.5 M EDTA to each sample. The reaction mixture was aspirated onto a pre-wet filtermat using a Skatron Micro96 Cell Harvester (Skatron, Inc.), then wash with PBS. The filtermat was then dried in a microwave oven for 1 min., treated with MeltiLex A scintillation wax (Wallac), and counted on a Microbeta scintillation counter Model 1450 (Wallac). Inhibition data were analyzed by nonlinear least-squares regression using Prism (GraphPad Software). The final concentration of reagents in the assays are ATP, 1 μ M; [γ -³³P]ATP, 3 nM; MBP (Sigma, # M1891), 2 μ g/well; p38, 10 nM; and DMSO, 0.3%.

Solid Phase Preparations of Compounds of Formula I

Compounds of Formula I may also be prepared on solid phase. Typically, an amino-functionalized resin, such as PEG-grafted polystyrene beads (*e.g.*, ArgoGel™), may be modified by reaction with *bis*-Fmoc lysine to increase the available reaction sites for ligand attachment. After deprotection, an aldehyde linker may be attached via the free amine sites. Reductive amination with a primary amine yields a resin-bound secondary amine. The following descriptions are illustrative of methods of preparing compounds of Formula I on solid phase.

Method 1

ArgoGel resin (3.0 g) with acid cleavable linker in a shaking vessel was washed with 1,2-dichloroethane twice. After draining, 120 mL of 1,2-dichloroethane was added, followed with the addition of cyclopentylamine (20 equivalents). The pH of the reaction mixture was adjusted to 5 with the addition of acetic acid. The reaction mixture was shaken at room temp for 15 min, and added with sodium triacetoxyborohydride (20 equivalents). After completion

of the addition, the reaction mixture was shaken at room temp for 16h. The resin was then filtered and washed with methanol and DCM (5 cycles).

The ArgoGel resin obtained above was washed with DMF twice. After draining, 50 mL of anhydrous DMF and Hunig's base (10 equivalents) were added, followed with the addition of 2-(5-aminocarbonyl-2-methyl)phenylamino-4,6-dichlorotriazine (3.0 equivalents). The reaction was allowed to proceed at room temp for 4h. The resin was then filtered and washed with methanol and DCM (5 cycles), and dried over vacuum.

ArgoGel resin (50 mg) obtained above was put into a small reaction vial. To the vial was added with anhydrous *n*-BUOH (1.0 mL) and 1-*N*-Boc-(3*R*)-aminopyrrolidine (0.5 mmol). The reaction mixture was heated to 70°C for 16h. The resin was then filtered and washed with methanol and DCM (5 cycles) and treated with a 50% solution of trifluoroacetic acid in DCM. The product was collected through filtration and purified by HPLC.

Method 2

This method allows for *N*-derivatization the solid supports.

The TentaGel™ resin (3.5 g) attached with the acid cleavable linker was washed with 1,2-dichloroethane twice (5 min shaking each time). After drained, the resin was added with 1,2-dichloroethane (30 mL). (3*R*)-amino-1-pyrrolidine allyl carbamate (1.00 g) was added and the pH of the solution was adjusted to 5 by the addition of acetic acid. The reaction mixture was shaken at room temp for 15 min, before the addition of sodium triacetoxyborohydride (10 equiv.). The reaction mixture was shaken at room temp for overnight. The resin was filtered and washed with methanol, DCM, and THF. Then it was dried over vacuum.

0.9 g of the above-obtained resin was washed with DMF twice and suspended into DMF (8 mL). To the resin suspension, Hunig's base (5.0 equiv.) was added, and then the dichlorotriazine derivative (3.0 equiv.). The reaction mixture was shaken at room temp for 4h. The resin was filtered and washed with DMF, methanol, DCM, and then suspended in DMSO (6 mL). The suspension was added with 1-isobutyl-1-methylamine (10 equiv.). The reaction mixture was heated to 80°C overnight. The resin was filtered and washed with methanol, DCM, and THF. Then it was dried over vacuum.

50 mg of the above-obtained resin was suspended into THF (3 mL). Tetrakis(triphenylphosphine)palladium(0) (0.15 g) and 5,5-dimethyl-1,3-cyclohexane-dione (10 equiv.) were added. The reaction mixture was shaken at room temp for overnight. The resin was washed with 0.5 % solution of sodium diethyldithiocarbamate in DMF, and then 0.5% DMF solution of Hunig's base before it was washed with methanol, DCM.

The resin was washed with 1,2-dichloroethane twice and suspended in 1,2-dichloroethane (3 mL). Acetone (0.1 mL) and sodium triacetoxyborohydride (10 equiv.) were

added. The reaction mixture was shaken at room temp for overnight. The resin was filtered and washed with methanol, DCM, and cleaved with TFA/DCM (1:1). The cleavage gave the crude final product in an 80% overall yield.

General Procedures for Synthesis of 3-(4,6-Bis-alkylamino-pyrimidin-2-ylamino)-4-methyl-benzamides.

3-[4-Cyclopentylamino-6-[(2,2-dimethyl-propyl)-methyl-amino]-pyrimidin-2-ylamino]-4-methyl-benzamide

3-Amino-4-methyl-benzamide (1 molar equivalent) was added to a room temp solution of trifluoropyrimidine (1 molar equivalent) and DIEPA (1.5 molar equivalents), in THF. The reaction stirred for 24h, then was concentrated *in vacuo*. The resulting mixture of 2- and 4-pyrimidine products were separated by silica gel chromatography.

The substituted pyrimidine (34 mg, 0.12 mmol), resin bound-amine (140 mg, 0.07 mmol) and DIPEA (50 μ L, 0.28 mmol) in DMSO (1 mL) was heated to 120°C for 24h. The resin was washed with DMF (3x) and DCM (3x).

The resulting resin was reacted with amine (120 mg 1.1 mmol) in DMSO (0.5 mL) at 80°C for 18h. The resin was washed with DMF (3x), MeOH (3x), DCM (3x), then treated with TFA to release the product. The crude product was purified by preparative HPLC. MS (m/z) calcd for $C_{23}H_{35}N_6O$ (MH^+), 411; found, 411.

N-(3-{4-Cyclopentylamino-6-[(2,2-dimethyl-propyl)-methyl-amino]-pyrimidin-2-ylamino}-4-methyl-benzyl)-acetamide

The resin-bound phthalimide was prepared using standard methods. A suspension of resin (200 mg) in 2M hydrazine/ethanol (20 mL) was stirred for 4h at room temp. The resin was washed with MeOH (3x), DMF (3x), DCM (3x), then dried under high vacuum.

Acetic anhydride (40 μ L, 0.42 mmol), was added to a vial containing resin (80 mg, 0.04 mmol), DMAP (cat.) in 10% pyridine/DCM. The reaction stirred for 16h at room temp. The resin was washed with DCM (3x), MeOH (3x), DCM (3x). Upon stirring of the resin in 1 mL of TFA for 3h, the product was released. The solution was concentrated *in vacuo* and the residue was purified by Prep-HPLC. MS (m/z) calcd for $C_{25}H_{39}N_6O$ (MH^+), 440; found, 440.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US 00/35289

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 18-30 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☒ Claims Nos.: 1
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1

Present claim 1 relates to an extremely large number of possible compounds/. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds in which at least 2 of W, Y and X are =N-; Z is as in claim 2 i.e. limited to amino or thioether derivatives, R9 is as in claim 2 i.e. -C(O)R10 and R11 is as in claim 2 i.e. N(R12)(R13). This encompasses all of the examples.

Present claim 14 relates to a prodrugs i.e. compounds defined by reference to a desirable characteristic or property, namely their ability to be converted to compounds of formula I

Claim 14 covers all compounds having this characteristic or property, whereas the application provides support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT for only a very limited number of such compounds. In the present case, the claim so lacks support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Independent of the above reasoning, the claim also lacks clarity (Article 6 PCT). An attempt is made to define the compounds by reference to a result to be achieved. Again, this lack of clarity in the present case is such as to render a meaningful search over the whole of the claimed scope impossible. Consequently, the search has been carried out for those parts of the claim which appear to be clear, supported and disclosed, namely those parts relating to the compounds I. Prodrugs have not been searched.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
